

Question: Write a Java program named TimeCompare that enables users to compare two values with different units by:

1. Entering the units as strings:

- `hr_min`: Compares Hours to Minutes
 - 1 hr = 60 minutes
 - 1 minute = 1/60 hour
- `day_hr`: Compares Days to Hours
 - 1 Day = 24 hours
 - 1 hour = 1/24 day
- `sec_millisecond`: Compares Seconds to Milliseconds
 - 1 sec = 1000 millisecond
 - 1 millisecond = 1/1000 second

2. Entering two numbers: The first number represents the value in the first unit, and the second number represents the value in the second unit.

The program should ensure that the unit strings are case-insensitive and reject invalid operations, displaying an error message accordingly. The results should indicate which value is greater and display both values in the unit of the greater value.

Sample Runs:

Run 1:

Enter the units (`hr_min`, `day_hr`, `sec_millisecond`): `hr_min`
Enter two numbers: 2 150
150.0 minutes is greater than 120.0 minutes

Run 2:

Enter the units (`hr_min`, `day_hr`, `sec_millisecond`): `HR_mIn`
Enter two numbers: 3.5 90
3.5 hours is greater than 1.5 hours

Run 3:

Enter the units (`hr_min`, `day_hr`, `sec_millisecond`): `test`
Invalid operation

Run 4:

Enter the units (`hr_min`, `day_hr`, `sec_millisecond`): `day_hr`
Enter two numbers: 1 36
36.0 hours is greater than 24.0 hours

Run 5:

Enter the units (`hr_min`, `day_hr`, `sec_millisecond`): `sec_millisecond`
Enter two numbers: 1 1000
1.0 seconds is equal to 1000.0 milliseconds

Run 6:

Enter the units (`hr_min`, `day_hr`, `sec_millisecond`): `SeC_MilliSec`
Enter two numbers: 2.5 4000
4000.0 milliseconds is greater than 2500.0 milliseconds
