Classes and Objects

CSC 111

Evaluation Question (Wednesday)

Q) Create a Product class with attributes name, category, and stock. Implement getters and setters for each attribute. Write a constructor (with parameters) that will be used to initialize the attributes. A displayInfo method should print all the product's details. Create a Product object with name as "Laptop", category as "Electronics" and stock as "50". Call the displayInfo method to print all the details. Use the setter to change the product's stock to "45". Print all the details again.

Product
- name: String - category: String - stock: int
+ Constructor + displayInfo: void + getters/setters
