

Week#3 Lab

Variables, Data types, Assignments, Simple Input

CSC 111

Evaluation Question (Wednesday)

Q) Write a Java program, named RentPrice, that calculates the total rent price of renting a car after applying a discount and adding sales tax. The program should take the number of days the car will be rented and rent per day as inputs.

Assume:

- Tax Rate = 15% of the rent
- Discount Rate = 1% of the number of days

Hint:

Price Before Tax = (number of days * rent per day) * (1 - Discount Rate)

Rent Price = Price Before Tax + (Price Before Tax * Tax Rate)

Note: Define suitable variables and constants.

Sample Run 1:

Enter the number of days: 7

Enter the rent per day: 100

Rent Price = 748.65 SAR

Sample Run 2:

Enter the number of days: 30

Enter the rent per day: 120.5

Rent Price = 2910.075 SAR
