Class Constructors, static variable & Methods

CSC 111

Evaluation Question

A class Food whose objects represent a food and its calories information. The class has following attributes and methods:

- **totalCal:** the total calories.
 - **fatCal:** the fat calories
 - **foodCount** : is used to keeps track of how many objects of Food class have been created.
 - **Food()**: initialize the attributes with String "", double 0, double 0
 - **Food (String ty, double t, double f):** initializes all attributes using the passed parameters.
 - **readData()**: should contain the prompts that asks the user to enter the data and store them in the attributes.
 - **diaplayInfo()**: prints all the attributes.
- Implement a class FoodTest with the main method to do the following:
 - **create 2 objects of Food:**
 - obj1 must be created using the parameterized constructor, and use the data ➔ juice , 200 , 20
 - obj2, must be created using the default constructor. read data of obj2 using the method readData().
 - Display the information of obj1 ,obj2.
 - In a meaningful message, Print How many objects of class Food have been created.

Food
- type: String - totalCal: double - fatCal: double + <u>foodCount: int</u>
+ Food() + Food(String ty, double t, double f) + readData(): void + diaplayInfo():void + setters & getters (as needed)
